Application number: DE20001059126 20001129
Priority number(s): DE20001059126 20001129

Abstract of DE10059126

The method involves transmitting identification information (a) from a user's mobile unit (1) to a central station (2). The central station identifies the user by evaluating the information, and then transmits a release signal (b) to the machine (3), which allows the user to use it and determines the payment applicable. The mobile unit may be a mobile telephone, which is used to call a special number of a network operator. An Independent claim is included for a payment-operated machine.
